Unimodality and Log-concavity

Let $\{a_i\}_{i\geqslant 0}$ be a sequence of positive real numbers.

- It is unimodal if $a_0 \leqslant a_1 \leqslant \cdots \leqslant a_m \geqslant a_{m+1} \geqslant \cdots$.
- It is log-concave if $a_i^2 \geqslant a_{i-1}a_{i+1}$ for $i \geqslant 1$.

<ロ > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 る の へ ○ < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回 > < 回

Unimodality and Log-concavity

Let $\{a_i\}_{i\geqslant 0}$ be a sequence of positive real numbers.

- It is unimodal if $a_0 \leqslant a_1 \leqslant \cdots \leqslant a_m \geqslant a_{m+1} \geqslant \cdots$.
- It is log-concave if $a_i^2 \geqslant a_{i-1}a_{i+1}$ for $i \geqslant 1$.

Remark

 $Log-concavity \Longrightarrow Unimodality.$

Unimodality and Log-concavity

Let $\{a_i\}_{i\geqslant 0}$ be a sequence of positive real numbers.

- It is unimodal if $a_0 \leqslant a_1 \leqslant \cdots \leqslant a_m \geqslant a_{m+1} \geqslant \cdots$.
- It is log-concave if $a_i^2 \geqslant a_{i-1}a_{i+1}$ for $i \geqslant 1$.

Remark

 $\mathsf{Log\text{-}concavity} \Longrightarrow \mathsf{Unimodality}.$

Example

Each row in Pascal's triangle $\binom{n}{k}_{k=0}^n$ is log-concave.

Unimodality problems in combinatorics are surveyed by Stanley (1989), Brenti (1994) and Brändén (2014).

Unimodality in Pascal's triangle

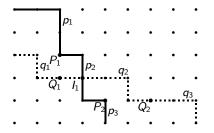

Theorem (Su-Wang, Elec JC 2008)

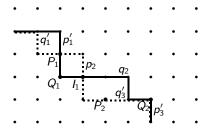

The sequence $\{\binom{n_0-ia}{k_0+ib}\}_{i\geqslant 0}$ is log-concave, where $n_0\geqslant k_0\geqslant 0$, $a,b\geqslant 0$.

$$\begin{pmatrix} 0 \\ 0 \end{pmatrix} \qquad \begin{pmatrix} 1 \\ 0 \end{pmatrix} \qquad \begin{pmatrix} 1 \\ 1 \end{pmatrix} \qquad \begin{pmatrix} 2 \\ 0 \end{pmatrix} \qquad \begin{pmatrix} 2 \\ 1 \end{pmatrix} \qquad \begin{pmatrix} 2 \\ 2 \end{pmatrix} \qquad \begin{pmatrix} 3 \\ 0 \end{pmatrix} \qquad \begin{pmatrix} 3 \\ 1 \end{pmatrix} \qquad \begin{pmatrix} 3 \\ 2 \end{pmatrix} \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \qquad \begin{pmatrix} 3 \\ 3 \end{pmatrix} \qquad \begin{pmatrix} 4 \\ 4 \end{pmatrix} \qquad \begin{pmatrix} 4 \\ 1 \end{pmatrix} \qquad \begin{pmatrix} 4 \\ 2 \end{pmatrix} \qquad \begin{pmatrix} 4 \\ 3 \end{pmatrix} \qquad \begin{pmatrix} 4 \\ 4 \end{pmatrix} \qquad \begin{pmatrix} 5 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 5 \\ 0 \end{pmatrix} \qquad \begin{pmatrix} 5 \\ 1 \end{pmatrix} \qquad \begin{pmatrix} 5 \\ 2 \end{pmatrix} \qquad \begin{pmatrix} 5 \\ 3 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 4 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 6 \end{pmatrix} \qquad \begin{pmatrix} 6 \\ 5 \end{pmatrix} \qquad \begin{pmatrix} 6$$

Combinatorial proof of the log-concavity

TP and PF

- An infinite matrix M is totally positive (TP) if every minor is nonnegative.
- A nonnegative sequence $\{a_i\}_{i\geqslant 0}$ is a Pólya frequency (PF) sequence if the matrix $(a_{j-i})_{i,j}$ is TP, where $a_i\equiv 0$ for i<0.
- A finite sequence a_0, a_1, \ldots, a_n is PF if the infinite sequence $a_0, a_1, \ldots, a_n, 0, 0, \ldots$ is PF.

TP and PF

- An infinite matrix M is totally positive (TP) if every minor is nonnegative.
- A nonnegative sequence $\{a_i\}_{i\geqslant 0}$ is a Pólya frequency (PF) sequence if the matrix $(a_{j-i})_{i,j}$ is TP, where $a_i\equiv 0$ for i<0.
- A finite sequence a_0, a_1, \ldots, a_n is PF if the infinite sequence $a_0, a_1, \ldots, a_n, 0, 0, \ldots$ is PF.

Example

Each row in Pascal's triangle $\binom{n}{k}_{k=0}^n$ is PF.

TP and PF

- An infinite matrix M is totally positive (TP) if every minor is nonnegative.
- A nonnegative sequence $\{a_i\}_{i\geqslant 0}$ is a Pólya frequency (PF) sequence if the matrix $(a_{j-i})_{i,j}$ is TP, where $a_i\equiv 0$ for i<0.
- A finite sequence a_0, a_1, \ldots, a_n is PF if the infinite sequence $a_0, a_1, \ldots, a_n, 0, 0, \ldots$ is PF.

Example

Each row in Pascal's triangle $\binom{n}{k}_{k=0}^n$ is PF.

Theorem (Yu, Adv.Appl. Math. 2009, conjectured by Su-Wang)

The finite sequence $\{\binom{n_0-ia}{k_0+ib}\}_{i\geqslant 0}$ is PF, where $n_0\geqslant k_0\geqslant 0$, $a,b\geqslant 0$.

Gaussian polynomials (q-binomial coefficients)

The *q*-binomial coefficient is defined to be

$$\begin{bmatrix} n \\ k \end{bmatrix}_{q} = \frac{(q^{n}-1)(q^{n-1}-1)\cdots(q^{n-k+1}-1)}{(q^{k}-1)(q^{k-1}-1)\cdots(q-1)}.$$

Recurrence:

$$\left[\begin{array}{c} n \\ k \end{array}\right]_q = q^k \left[\begin{array}{c} n-1 \\ k \end{array}\right]_q + \left[\begin{array}{c} n-1 \\ k-1 \end{array}\right]_q.$$

It is the generating function for the partitions fitting inside an $(n-k) \times k$ rectangle.

Unimodality of q-binomial coefficients

Theorem

Every q-binomial coefficient is a unimodal polynomial in q.

- This was conjectured by Cayley (1856) and proved first by Sylvester (1878) using invariant theory.
- Stanley (1980) proved it via the hard Lefschetz theorem.
- Macdonald (1980) generalize it to Schur function.
- O'Hara (1990) gave a combinatorial proof. Her chain construction was modeled by Zeilberger (1989).
- Pak and Panova (2013) proved the strict unimodality of q-multinomial coefficients.
- Andrews (1998) showed the unimodality of *q*-multinomial coefficients.

Unimodality of the difference of q-binomial coefficients

Theorem

If n is odd and $2k \leqslant n+1$, then $\begin{bmatrix} n \\ k \end{bmatrix}_q - \begin{bmatrix} n \\ k-1 \end{bmatrix}_q$ is a unimodal polynomial in q with non-negative coefficients.

- The above polynomial is called Kostka polynomial.
- Andrews (1993) proved the non-negativity.
- Reiner and Stanton (1998) showed the unimodality.

An application to *q*-ballot numbers

Allen gave the following q-analogue of ballot numbers:

$$B_q(n,r) = \frac{[2n-1]!_q[2r]_q}{[n+r]_q![n-r]_q!} = \frac{1}{q^{n-r}} \left(\left[\begin{array}{c} 2n-1 \\ n+r-1 \end{array} \right]_q - \left[\begin{array}{c} 2n-1 \\ n+r \end{array} \right]_q \right).$$

Corollary (conjectured by Allen, thesis 2014)

The polynomial $B_q(n,r)$ is unimodal.

The q-analogue of unimodality and log-concavity

Write $f(q) \geqslant_q g(q)$ if f(q) - g(q) is a polynomial in q with nonnegative coefficients. Let $\{a_i(q)\} \geqslant 0$ be a sequence of polynomials with nonnegative coefficients.

• It is q-unimodal if

$$a_0(q) \leqslant_q a_1(q) \leqslant_q \cdots \leqslant_q a_m(q) \geqslant_q a_{m+1}(q) \geqslant_q \cdots$$

• It is *q*-log-concave (introduced by Butler) if for $i \ge 1$,

$$a_i^2(q) \geqslant_q a_{i-1}(q)a_{i+1}(q).$$

• It is strongly *q*-log-concave (introduced by Stanley) if for $j \geqslant i \geqslant 1$,

$$a_i(q)a_j(q) \geqslant_q a_{i-1}(q)a_{j+1}(q).$$

The q-analogue of unimodality and log-concavity

Write $f(q) \geqslant_q g(q)$ if f(q) - g(q) is a polynomial in q with nonnegative coefficients. Let $\{a_i(q)\} \geqslant 0$ be a sequence of polynomials with nonnegative coefficients.

• It is q-unimodal if

$$a_0(q) \leqslant_q a_1(q) \leqslant_q \cdots \leqslant_q a_m(q) \geqslant_q a_{m+1}(q) \geqslant_q \cdots$$

• It is q-log-concave (introduced by Butler) if for $i \ge 1$,

$$a_i^2(q) \geqslant_q a_{i-1}(q)a_{i+1}(q).$$

• It is strongly *q*-log-concave (introduced by Stanley) if for $j \geqslant i \geqslant 1$,

$$a_i(q)a_j(q) \geqslant_q a_{i-1}(q)a_{j+1}(q).$$

Example

For fixed n, the sequence $\left\{ \begin{bmatrix} n \\ k \end{bmatrix}_q \right\}_k$ is q-unimodal.

Strong *q*-log-concavity of *q*-binomial coefficients

Theorem (Butler, JCTA 1990)

For fixed n, the sequence $\left\{ \begin{bmatrix} n \\ k \end{bmatrix}_q \right\}_k$ is strongly q-log-concave.

Theorem (Sagan, Trans. AMS 1992)

For fixed k, the sequence $\left\{ \begin{bmatrix} n \\ k \end{bmatrix}_q \right\}_n$ is strongly q-log-concave.

Let $\mathbb{X} = \{x_1, x_2, \ldots\}$ be a countably infinite set of variables. The elementary and complete homogeneous symmetric functions of degree k in x_1, x_2, \ldots, x_n are defined by

$$e_k(n) := e_k(x_1, x_2, \dots, x_n) = \sum_{1 \le i_1 < i_2 < \dots < i_k \le n} x_{i_1} x_{i_2} \cdots x_{i_k},$$

$$h_k(n) := h_k(x_1, x_2, \dots, x_n) = \sum_{1 \le i_1 \le i_2 \le \dots \le i_k \le n} x_{i_1} x_{i_2} \cdots x_{i_k},$$

where $e_0(n) = h_0(n) = 1$ and $e_k(n) = 0$ for k > n. Set $e_k(n) = h_k(n) = 0$ unless $k, n \ge 0$, and $e_k(0) = h_k(0) = \delta_{0,k}$, where $\delta_{0,k}$ is the Kronecker delta.

Theorem (Su-Wang-Yeh, EJC 2011)

Let $\{x_i\}_{i\geq 1}$ be a sequence of polynomials in q with nonnegative coefficients. If the sequence $\{x_i\}_{i\geq 1}$ is strongly q-log-concave, then for the fixed integers a,b,n_0 and k_0 satisfying $ab\geq 0$, $n_0\geq k_0$, the sequences

$$\{e_{k_0-ib}(n_0+ia)\}_{i\in\mathbb{Z}}, \qquad \{h_{k_0-ib}(n_0+ia)\}_{i\in\mathbb{Z}}$$

are strongly q-log-concave respectively.

Theorem (Su-Wang-Yeh, EJC 2011)

Let $\{x_i\}_{i\geq 1}$ be a sequence of polynomials in q with nonnegative coefficients. If the sequence $\{x_i\}_{i\geq 1}$ is strongly q-log-concave, then for the fixed integers a,b,n_0 and k_0 satisfying $ab\geq 0$, $n_0\geq k_0$, the sequences

$$\{e_{k_0-ib}(n_0+ia)\}_{i\in\mathbb{Z}}, \qquad \{h_{k_0-ib}(n_0+ia)\}_{i\in\mathbb{Z}}$$

are strongly q-log-concave respectively.

Remark

- This answers a question proposed by Sagan (Trans. AMS 1992).
- Some special cases follow from Jacobi-Trudi identity.

Strong *q*-log-concavity of *q*-binomial coefficients

$$\begin{bmatrix} n \\ k \end{bmatrix} = q^{-\binom{k}{2}} e_k(1, q, \dots, q^{n-1}) = h_k(1, q, \dots, q^{n-k}).$$

Strong *q*-log-concavity of *q*-binomial coefficients

$$\begin{bmatrix} n \\ k \end{bmatrix} = q^{-\binom{k}{2}} e_k(1, q, \dots, q^{n-1}) = h_k(1, q, \dots, q^{n-k}).$$

Theorem (Su-Wang-Yeh, EJC 2011)

For $n_0 \geqslant k_0 \geqslant 0$, $a, b \geqslant 0$, the sequence

$$\left\{ \begin{bmatrix} n_0 - ia \\ k_0 + ib \end{bmatrix}_q \right\}_{i \geqslant 0} \quad \text{and} \quad \left\{ q^{\binom{k_0 + ib}{2}} \begin{bmatrix} n_0 - ia \\ k_0 + ib \end{bmatrix} \right\}_{i \geqslant 0}$$

is strongly q-log-concave.

the *q*-Stirling numbers of two kinds

The q-Stirling numbers of two kinds in terms of symmetric function:

$$c[n, k] = e_{n-k}([1], [2], \dots, [n-1]),$$

 $S[n, k] = h_{n-k}([1], [2], \dots, [k]),$

the q-Stirling numbers of two kinds

The q-Stirling numbers of two kinds in terms of symmetric function:

$$c[n, k] = e_{n-k}([1], [2], \dots, [n-1]),$$

 $S[n, k] = h_{n-k}([1], [2], \dots, [k]),$

Note that the sequence $\{[i]\}_{i\geq 1}$ are strongly q-log-concave.

Corollary (Su-Wang-Yeh, EJC 2011)

Let n_0, k_0, a, b be four nonnegative integers, where $n_0 \ge k_0$. The following sequences are all strongly q-log-concave:

- (i) $\{c[n_0 + ia, k_0 + ib]\}_{i \geq 0}$, with $b \geq a \geq 0$;
- (ii) $\{S[n_0 ia, k_0 + ib]\}_{i>0}$, with $a, b \ge 0$;
- (iii) $\{S[n_0 + ia, k_0 + ib]\}_{i>0}$, with $b \ge a \ge 0$.

Strong *q*-log-concavity of *q*-multinomial coefficients

$$\begin{bmatrix} m_1+m_2+\cdots+m_n \\ m_1,m_2,\ldots,m_n \end{bmatrix}_q = \begin{cases} \frac{[m_1+m_2+\cdots+m_n]!}{[m_1]![m_2]!\cdots[m_n]!}, & \text{if } m_k \in \mathbb{N} \text{ for all } k; \\ 0, & \text{otherwise.} \end{cases}$$

Strong *q*-log-concavity of *q*-multinomial coefficients

$$\begin{bmatrix} m_1+m_2+\cdots+m_n \\ m_1,m_2,\ldots,m_n \end{bmatrix}_q = \begin{cases} \frac{[m_1+m_2+\cdots+m_n]!}{[m_1]![m_2]!\cdots[m_n]!}, & \text{if } m_k \in \mathbb{N} \text{ for all } k; \\ 0, & \text{otherwise.} \end{cases}$$

Theorem (q-analogue of a result by Su-Wang-Yeh, 2011)

For $d_1 \geqslant \sum_{k=1}^n d_k \geqslant 0$, the sequence

$$\left\{ \left[\sum_{k=1}^{n} m_k + i \sum_{k=1}^{n} d_k \atop m_1 + i d_1, m_2 + i d_2, \dots, m_n + i d_n \right]_q \right\}_{i \geqslant 0}$$

is strongly q-log-concave.

Outline

1 Unimodality of *q*-binomial coefficients

- ② Unimodality of over-(q, t)-binomial coefficients
- 3 Over-(q, t)-binomial coefficients and super Schur functions

An overpartition analogue of the q-binomial coefficients

An overpartition is a partition in which the last occurrence of each distinct number may be overlined. The eight overpartitions of 3 are

$$(3), (\overline{3}), (2,1), (\overline{2},1), (2,\overline{1}), (\overline{2},\overline{1}), (1,1,1), (1,1,\overline{1}).$$

Dousse and Kim (JCTA, 2018) defined over-(q, t)-binomial coefficients by

$$\overline{\left[\begin{array}{c} m+n \\ n \end{array}\right]}_{q,t} := \sum_{k,N\geqslant 0} \overline{p}(m,n,k,N) t^k q^N,$$

where $\bar{p}(m, n, k, N)$ counts the number of overpartitions of N, with k overlined parts, fitting inside an $m \times n$ rectangle.

An overpartition analogue of the q-binomial coefficients

An overpartition is a partition in which the last occurrence of each distinct number may be overlined. The eight overpartitions of 3 are

$$(3), (\overline{3}), (2, 1), (\overline{2}, 1), (2, \overline{1}), (\overline{2}, \overline{1}), (1, 1, 1), (1, 1, \overline{1}).$$

Dousse and Kim (JCTA, 2018) defined over-(q, t)-binomial coefficients by

$$\left[\begin{array}{c} m+n \\ n \end{array}\right]_{q,t} := \sum_{k,N\geqslant 0} \bar{p}(m,n,k,N) t^k q^N,$$

where $\bar{p}(m, n, k, N)$ counts the number of overpartitions of N, with k overlined parts, fitting inside an $m \times n$ rectangle.

The over-(q, t)-binomial coefficients reduce to

- *q*-binomial coefficients when t = 0.
- over-q-binomial coefficients (Dousse and Kim, 2017) when t = 1.
- Delannoy numbers when q = t = 1.

Around over-(q, t)-binomial coefficients

$$\begin{bmatrix} m+n \\ n \end{bmatrix}_{q,t} = \begin{bmatrix} n+m \\ m \end{bmatrix}_{q,t},$$

$$\overline{\begin{bmatrix} m+n \\ n \end{bmatrix}}_{q,t} = \sum_{k=0}^{\min\{m,n\}} t^k q^{\frac{k(k+1)}{2}} \frac{(q)_{m+n-k}}{(q)_k(q)_{m-k}(q)_{n-k}},$$

$$\left[\begin{array}{c} m+n \\ n \end{array} \right]_{q,t} = \left[\begin{array}{c} m+n-1 \\ n-1 \end{array} \right]_{q,t} + q^n \left[\begin{array}{c} m+n-1 \\ n \end{array} \right]_{q,t} + tq^n \left[\begin{array}{c} m+n-2 \\ n-1 \end{array} \right]_{q,t}$$

Strong (q, t)-log-concavity of over-(q, t)-binomial coefficients

Theorem (Dousse-Kim, JCTA 2018)

For fixed n, $\left\{ \begin{bmatrix} n \\ k \end{bmatrix}_{q,t} \right\}_{k \geqslant 0}$ is strongly (q,t)-log-concave. That is,

$$\left[\begin{array}{c} n \\ k \end{array} \right]_{q,t} \left[\begin{array}{c} n \\ \ell \end{array} \right]_{q,t} - \left[\begin{array}{c} n-1 \\ k-1 \end{array} \right]_{q,t} \left[\begin{array}{c} n+1 \\ \ell+1 \end{array} \right]_{q,t}$$

is a bivariate polynomial in q and t with nonnegative coefficients.

<ロ > ← □ > ← □ > ← □ > ← □ = ・ の へ ○ ·

A unified result

Theorem (Su, 2020)

For
$$n_0 \geqslant k_0 \geqslant 0$$
, $a,b \geqslant 0$, the sequence $\left\{ \overline{\left[\begin{array}{c} n_0 - ia \\ k_0 + ib \end{array} \right]}_{q,t} \right\}_{i \geqslant 0}$ is strongly $(q^u,tq^v,1)$ -log-concave. That is, for $j \geqslant i \geqslant 1$,

$$\overline{\left[\begin{array}{c}n_0-ia\\k_0+ib\end{array}\right]}_{q,t}\overline{\left[\begin{array}{c}n_0-ja\\k_0+jb\end{array}\right]}_{q,t}-\overline{\left[\begin{array}{c}n_0-ia+a\\k_0+ib-b\end{array}\right]}_{q,t}\overline{\left[\begin{array}{c}n_0-ja-a\\k_0+jb+b\end{array}\right]}_{q,t}$$

is a polynomial with nonnegative coefficients, where each monomial is the product of q^u 's and tq^v 's.

<ロ > < 回 > < 回 > < 直 > くき > しき と き と の < (で)

Connection to Delannoy numbers

Note that

$$\overline{\left[\begin{array}{c} m+n \\ n \end{array}\right]_{q,t}} = \sum_{k=0}^{\min\{m,n\}} t^k q^{\frac{k(k+1)}{2}} \left[\begin{array}{c} m+n-k \\ k,m-k,n-k \end{array}\right]_q.$$

Connection to Delannoy numbers

Note that

$$\overline{\left[\begin{array}{c} m+n \\ n \end{array}\right]_{q,t}} = \sum_{k=0}^{\min\{m,n\}} t^k q^{\frac{k(k+1)}{2}} \left[\begin{array}{c} m+n-k \\ k,m-k,n-k \end{array}\right]_q.$$

The over-(q, t)-binomial coefficients reduce to

- Delannoy numbers when t = q = 1.
- q-Delannoy numbers (defined by Sagan) when q=1 after exchanging q and t.

Main corollaries

Corollary (Dousse-Kim, JCTA 2018)

For $1 \leqslant k \leqslant \ell \leqslant n-1$,

$$\overline{\left[\begin{array}{c} n \\ k \end{array}\right]_{q,t}} \overline{\left[\begin{array}{c} n \\ \ell \end{array}\right]_{q,t}} - \overline{\left[\begin{array}{c} n-1 \\ k-1 \end{array}\right]_{q,t}} \overline{\left[\begin{array}{c} n+1 \\ \ell+1 \end{array}\right]_{q,t}}$$

has non-negative coefficients as a polynomial in q and t.

Corollary (Dousse-Kim, JCTA 2018)

For $1 \leqslant k \leqslant \ell \leqslant n-1$, The q-Delannoy numbers satisfy

$$D_q(n-k,k)D_q(n-\ell,\ell) \geqslant_q D_q(n-k+1,k-1)D_q(n-\ell-1,\ell+1),$$

 $D_q(n-k,k)D_q(n-\ell,\ell) \geqslant_q D_q(n-k,k-1)D_q(n-\ell,\ell+1).$

A unimodality problem of over-(q, t)-binomial coefficients

Recall

$$\overline{\begin{bmatrix} m+n \\ n \end{bmatrix}}_{q,t} = \sum_{k=0}^{\min\{m,n\}} t^k q^{\frac{k(k+1)}{2}} \begin{bmatrix} m+n-k \\ k,m-k,n-k \end{bmatrix}_q.$$

Conjecture (Dousse-Kim, JCTA 2018)

For every positive m and n, $\begin{bmatrix} m+n \\ n \end{bmatrix}_{q,1}$ is unimodal in q.

A unimodality problem of over-(q, t)-binomial coefficients

Recall

$$\overline{\left[\begin{array}{c} m+n \\ n \end{array}\right]}_{q,t} = \sum_{k=0}^{\min\{m,n\}} t^k q^{\frac{k(k+1)}{2}} \left[\begin{array}{c} m+n-k \\ k,m-k,n-k \end{array}\right]_q.$$

Conjecture (Dousse-Kim, JCTA 2018)

For every positive m and n, $\begin{bmatrix} m+n \\ n \end{bmatrix}_{a,1}$ is unimodal in q.

Proposition (Brenti-Sentinelli, arXiv:2008.02383, 2020)

The polynomial $\sum_{\{\lambda \in \overline{\mathcal{P}}: \lambda_1 \le n, \ell(\lambda) = m\}} q^{|\lambda|}$ is symmetric and unimodal.

Outline

1 Unimodality of q-binomial coefficients

- 2 Unimodality of over-(q, t)-binomial coefficients
- 3 Over-(q, t)-binomial coefficients and super Schur functions

Q-binomial coefficients and Schur functions

Let λ be a partition. Stanley (1989) proved that the principal specialization of Schur function $s_{\lambda}(1, q, \ldots, q^{n-1})$ is a symmetric and unimodal polynomial in q.

It follows that

$$s_k(1,q,\ldots,q^{n-1})=\begin{bmatrix}n+k-1\\k\end{bmatrix}$$

is symmetric and unimodal.

Super-Schur functions

Let $\mathbf{x} = \{x_1, x_2, \ldots\}$ and $\mathbf{y} = \{y_1, y_2, \ldots\}$ be two sequences of independent variables and λ be a partition. The super-Schur function (or hook Schur function) corresponding to λ is defined to be

$$s_{\lambda}(x_1, x_2, \ldots / y_1, y_2, \ldots).$$

It arises in Lie superalgebras (Kač, Adv. Math. 1977, Rota et al, a new class of symmetric functions, 1982). It is known that

$$s_k(x_1, \ldots x_m/y_1, \ldots, y_n) = \sum_{j=0}^k h_j(x_1, \ldots x_m) e_{k-j}(y_1, \ldots, y_n).$$

Note that
$$e_k(y_1,\ldots,y_n)=s_k(\mathbf{0}/y_1,\ldots,y_n)$$
 and $h_k(x_1,\ldots,x_n)=s_k(x_1,\ldots,x_n/\mathbf{0}).$

Y-invariant diagraphs

Let D be a locally finite, weighted digraph. For a path $\pi=u_0u_1\cdots u_k$ in $D,\ w(\pi):=\prod_{i=1}^k w(u_{i-1},u_i)$. For a pair of vertices u and v, $P_D(u,v):=\sum_\pi w(\pi)$, where the sum is over all paths π in D from u to v.

y-invariant diagraph (Brenti, Adv. Math.1993): For any two pairs u,v and u',v',

$$P_D(u,v)=P_D(u',v'),$$

where u (resp. v) and u' (resp. v') have the same x-coordinate.

Y-invariant diagraphs and super-Schur functions

Theorem (Brenti, Adv. Math.1993)

There exists a y-invariant, locally finite, weighted digraph D such that

$$P_D((0,0),(n,k)) = s_k(x_1,\ldots,x_n/y_1,\ldots,y_n)$$

for all $(n, k) \in \mathbb{N} \times \mathbb{N}$.

$$P_D((0,0),(n,k)) = x_n P_D((0,0),(n,k-1)) + y_n P_D((0,0),(n-1,k-1)) + P_D((0,0),(n-1,k)).$$

Brenti's framework

Theorem (Brenti, JCTA 1995)

For $(n,k) \in \mathbb{N} \times \mathbb{N}$, define an infinite matrix $M = (M_{n,k})_{n,k \in \mathbb{N}}$ by

$$M_{n,k} := P_D((0,0),(n,k)).$$

Then

- (i) *M* is *TP*.
- (ii) every row of M is a PF sequence.

Application to over-(q, t)-binomial coefficients

Recall

$$\begin{bmatrix} m+n \\ n \end{bmatrix}_{q,t} = q^n \begin{bmatrix} m+n-1 \\ n \end{bmatrix}_{q,t} + tq^n \begin{bmatrix} m+n-2 \\ n-1 \end{bmatrix}_{q,t} + \begin{bmatrix} m+n-1 \\ n-1 \end{bmatrix}_{q,t}$$

Then

$$\begin{bmatrix} m+n \\ n \end{bmatrix}_{q,t} = P((0,0),(n,m))$$

$$= q^{n}P((0,0),(n,m-1)) + tq^{n}P((0,0),(n-1,m-1))$$

$$+P((0,0),(n-1,m))$$

$$= s_{k}(1,q,\ldots,q^{n-1}/tq,tq^{2},\ldots,tq^{n}).$$

Brenti's framework

Lemma (Brenti, JCTA 1995)

Let t be a nonnegative integer, and $\mathbf{x}=\{x_n\}, \mathbf{y}=\{y_n\}, \mathbf{z}=\{z_n\}$ be three sequences. Define a matrix $M=(M_{n,k})_{n,k\in\mathbb{N}}$ by

$$M_{n,k} := z_n M_{n-t,k-1} + y_n M_{n-1-t,k-1} + x_n M_{n-1,k}$$

if n + k is positive (where $M_{n,k} = 0$ if n < 0 or k < 0), and $M_{0,0} = 1$. Then

- (i) M is (x, y, z)-TP.
- (ii) every row of M is an (x, y, z)-PF sequence.

About strong *q*-log-concavity

Theorem (Su, 2020)

Let t be a nonnegative integer, and $\mathbf{x}=\{x_n\}, \mathbf{y}=\{y_n\}, \mathbf{z}=\{z_n\}$ be three sequences. Define a matrix $M=(M_{n,k})_{n,k\in\mathbb{N}}$ by

$$M_{n,k} = z_n M_{n-t,k-1} + y_n M_{n-1-t,k-1} + x_n M_{n-1,k}$$

if n+k is positive (where $M_{n,k}=0$ if n<0 or k<0), and $M_{0,0}=1$. If M is symmetric, i.e., $M_{n,k}=M_{k,n}$, then $\{M_{n_0-ia,k_0+ib}\}_{i\geqslant 0}$ is strongly $(\mathbf{x},\mathbf{y},\mathbf{z})$ -log-concave for fixed $n_0\geqslant k_0\geqslant 0$ and $a,b\geqslant 0$.

About *q*-PF

Theorem (Su, 2020)

Let $\{x_i\}_{i\geq 1}$ be a sequence of polynomials in q with nonnegative coefficients. If $x_{k-1}x_{\ell+1} = x_kx_\ell$ for $\ell \geqslant k$, then for the fixed integers a, b, n_0 and k_0 satisfying $ab \geqslant 0$, $n_0 \geqslant k_0$, the sequences $\{e_{k_0-ib}(n_0+ia)\}_{i\in \mathbb{Z}}$ are q-PF.

About *q*-PF

Theorem (Su, 2020)

Let $\{x_i\}_{i\geq 1}$ be a sequence of polynomials in q with nonnegative coefficients. If $x_{k-1}x_{\ell+1}=x_kx_\ell$ for $\ell\geqslant k$, then for the fixed integers a,b,n_0 and k_0 satisfying $ab\geqslant 0$, $n_0\geqslant k_0$, the sequences $\{e_{k_0-ib}(n_0+ia)\}_{i\in\mathbb{Z}}$ are q-PF.

Corollary (Su, 2020)

For $n_0 \geqslant k_0 \geqslant 0$, $a, b \geqslant 0$, the sequence

$$\left\{q^{\binom{k_0+ib}{2}} \begin{bmatrix} n_0 - ia \\ k_0 + ib \end{bmatrix}\right\}_{i \geqslant 0}$$

is q-PF.

About *q*-PF

Theorem (Su, 2020)

Let $\{x_i\}_{i\geq 1}$ be a sequence of polynomials in q with nonnegative coefficients. If $x_{k-1}x_{\ell+1}=x_kx_\ell$ for $\ell\geqslant k$, then for the fixed integers a,b,n_0 and k_0 satisfying $ab\geqslant 0$, $n_0\geqslant k_0$, the sequences $\{e_{k_0-ib}(n_0+ia)\}_{i\in\mathbb{Z}}$ are q-PF.

Corollary (Su, 2020)

For $n_0 \geqslant k_0 \geqslant 0$, $a, b \geqslant 0$, the sequence

$$\left\{q^{\binom{k_0+ib}{2}}\begin{bmatrix}n_0-ia\\k_0+ib\end{bmatrix}\right\}_{i\geqslant 0}$$

is q-PF.

• It doesn't hold for $\left\{ \begin{bmatrix} n_0 - ia \\ k_0 + ib \end{bmatrix}_q \right\}_{i \ge 0}$

A generalization of symmetric functions

Brenti (JCTA 1995) defined

$$e_k^{(t)}(n) := e_k^{(t)}(x_1, x_2, \dots, x_n) = \sum_{i_1, i_2, \dots, i_k} x_{i_1} x_{i_2} \cdots x_{i_k}$$

where the sum runs over all i_1, i_2, \ldots, i_k such that $i_{j+1} - i_j \ge t$ for all $0 \le j \le k-1$.

Note that
$$e_k^{(0)}(n) = h_k(n)$$
 and $e_k^{(1)}(n) = e_k(n)$.

Is there any application of this generalization?
